More Convenience in Gemstone Business

Innovations in industry software eXtra4<gemID>

Birkenfeld, 04.09.2020 Investments in convenience and efficiency characterize the latest development phase of eXtra4<gemID>, the gemstone management software. The industry solution for the gemstone sector from eXtra4 has undergone numerous ergonomic changes. eXtra4 Software + Service aims at significantly accelerating the work with the application. Visitors of the trade show Gemworld, in Munich/Germany - 30.10. - 01.11.2020 - can get an idea of the changes in the product of the IT subsidiary of the identity technology specialist Ferdinand Eisele at booth 500 in hall B5.

More information on the coded label

The characteristic portrait of each individual stone is the core element in gemstone management with eXtra4<gemID>. It is created

by classifying its quality features according to criteria that can be individually configured in the software. The data profile of the stone appears on labels in three different ways - as matrix code, as mnemonic code and in shortened clear text. Stone boxes labelled in this way enable efficient management via scanner.

Where originally 24 digits in the code encrypted the relevant properties of a stone, today 38 digits are available for more details and more precise profiling. There is also space for additional address data on the label. It is even possible to print a company logo using the thermal transfer label printer.

Improved database search

If you have to know for an offer which stones of a certain type are in stock, you need extensive search functions in the article master. In addition to a full text search, eXtra4<gemID> offers extended possibilities to set filters in the database. A new option are parameterized SQL queries. They allow to save the criteria for standard recurring searches. Without having to laboriously compile new search criteria over and over again, these queries are available at the push of a button.

Thanks to these features, eXtra4<gemID> delivers accurate search results with great reliability and shortens the response time of customer service. A particularly efficient feature is that the results of

a gemstone search can be selected and copied to a clipboard for the use in other documents. As a table in a letter or e-mail, the results complete each correspondence in a meaningful way.

Flexible list printing by integrated report designer

For the design and printing of individual lists, eXtra4 Software + Service uses the professional tool of a German software company: List&Label as a proven report generator is integrated in eXtra4<gemID>. With the help of this software tool, IT-experienced users are able to design any print-outs very comfortably. Detailed lists with individually defined contents for trade fair preparation and order papers for transaction processing are now quickly generated. There is no need for time-consuming manual compilation and entry. This saves time, errors and costs.

Vision comprehensive industry software

eXtra4 Software + Service has intensively used the time after the release of the multi-user version 18 month ago to boost the user-friendliness of the program. The developers have thus also transformed the software from the management of artistically designed unique pieces to the management of industrial mass products. Commercial processes, such as invoicing, bookkeeping, dunning or collection, are transferred to the standard merchandise management system operated by the user on site. It receives

necessary data from eXtra4<gemID> for import. Even a webshop

can be equipped with items from eXtra4<gemID> in this way.

Vision is an item management system that covers all the

requirements of the gemstone industry in all its facets and satisfies

artists, craftsmen, manufacturers and dealers.
